MANUAL NO-WATER SOLES SANITISER WITH DISINFECTING NEBULISATION

Designed for nebulising soles with disinfectant by means of fixed brushes without water, the equipment is particularly suitable for dry processing (flour, products) where water cannot be used for baking cleaning.

The disinfectant is nebulised by pressing the control start on the handrail.

In the model complete with hands nebuliser, the soles nebulisation is carried out right while sanitising your hands.

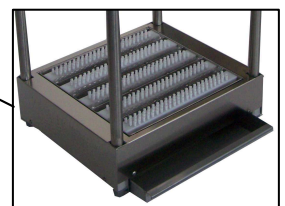

Lower pull-out container for collecting dirt and soles residues. Two handrails for user-friendly support.

Setup location is recommended at the work division entrance to prevent contamination in hazard-prone areas.

Compressed air supply required.

Control start
